

# Proper use instructions

Benji Altman

May 1, 2017

While in the home directory execute the file `compileAndRun.sh` as a shell script. It will produce a `JAR` file called `out.jar`. This jar file may be run using `java -jar out.jar myPascalFile.pas`. Just of course replace `myPascalFile.pas` with your desired target file. It will produce a file `out.asm`, which can be assembled to machine language or run in a `MIPS` interpreter.

If you aren't using a `UNIX` based system then you should install Ubuntu. Instructions can be found on Ubuntu's website, you'll need a 2GB or larger flash drive or external disk.

You could also use a virtual machine or just figure out how to compile on Windows but unfortunately we don't really support Windows explicitly.<sup>1</sup>

Some test programs have been left in `root/testInput`.

---

<sup>1</sup>It is written in Java and thus can be compiled in any Java supporting environment.
